

Peace – Learned this week about **“Macro and Micro Volume Relation Based Trading”**.

The AI Trade Assistant really helped me reinforce and bring clarity to this trade strategy approach.

Since the idea is to establish a simple approach that could be worked with to trade and create ongoing cash flow, here is the breakdown.

- 1) On the Daily chart, count the 5 days previous and add the “Anchored Volume Profile” to the chart. (Macro) – shows where Smart Money has been “Accumulating and Distributing”.
- 2) On the 4 hour or 1 hour chart, select the Fixed Volume Profile, and click the top and bottom of the recent range. (Micro) – Shows where “value” is now, and is the “decision” area of the current session.
- 3) Where is the Fixed Range Volume profile (Micro) **In Relation** to the Macro HVNs (High Volume nodes)? If price break and closes above/below the Fixed Range Volume Value area (with an FVG/Retrace/Closure), is there room for price to move before it reaches the next “Macro” HVN? (Any “Corn on the Cobb” left over until price reaches an HVN area where it might consolidate?) Price likes to consolidate near Macro HVNs. If Macro and Micro Volume profiles are in the same area, then expect “chop” and more consolidation.
- 4) Before Market Open, the questions are: Where is price in relation to the Fixed Range highs and lows? How is price responding to the VAL/P.O.C./VAH “Micro” levels, this will tell us about possible Smart Money Intention? If price is within the Micro range, then Smart Money is considered “Neutral”. If Neutral, then order flow within the “Accumulation Area” is the first signal. Withing the range, has price “swept” the VAL or VAH, and if so, did it stop near the P.O.C.? Did it test the opposing Value level? If price stopped at the P.O.C., then price may be building energy for a rally or sellers potential. Any sweep of a level, and then displacement, back into the range, this also tells us something.

- 5) If price displaces a VAH or VAL, then where is the “Location of the Acceptance”? Did price get accepted above or below the Micro Volume Profile, in a location that has room for price to move before a possible Macro HVN accumulation area?
