

The Unified Philosophy: Why Key Levels?

We decided to integrate the Key Levels from the "Momentum Flow Build" indicators because **an FVG in isolation is just price action, but an FVG at a Key Level is Institutional Intent**. By only considering trades at Asia/London highs/lows, 15m Opening Ranges, and HTF levels, the indicator ensures that every 1:2 setup has a high-probability "Why" behind it.

The Three Pillars of R.M.F. (Risk Management Fielding)

1. 1.5R: The "Mathematical Edge"

- Reaching 1.5R is the statistical "point of no return." By using this as the trigger to "Field" the stop loss, we secure the mathematical edge of the trade, ensuring that a significant move doesn't turn into a full loss.

2. Recent FVG Trail: "Structural Logic"

- Moving the stop to the nearest FVG at the 1.5R mark isn't just about moving to break-even; it's about anchoring the risk to the actual **structural support/resistance** that pushed the market to that profit level. This is the logic of the market's floor and ceiling.

3. Successive FVG Trail: "Probability Maximization"

- Once the trade is de-risked at 1.5R, the indicator follows every successive FVG. This allows the trader to stay in the move as long as the "Market Flow" remains intact, maximizing the probability of reaching the 2R target (or beyond) while the stop steps up behind the trend.
-

How it Operates (The Cycle):

Yes, your intuition is correct:

- **The Hunt:** The indicator remains in "WAITING" status until price engages a Key Level and confirms with an FVG-123.
- **The Protection:** Once in a trade, it manages the initial risk.
- **The Fielding:** At 1.5R, it "fields" the nearest structural FVG.

- **The Continuous Trail:** It will keep stepping the stop loss up (for longs) or down (for shorts) to every **newly formed FVG** until the price eventually takes the stop or hits the 2R target.
- **The Reset:** Once the stop is hit, the dashboard flips back to "WAITING," and the script ignores all mid-range price action until the **next Key Level** is triggered.

This creates a perfectly cyclical, mechanical workflow that removes emotion and keeps the trader focused on structural high-probability levels.

Peace.
