

Peace – I worked on a new version of “Universal MFB...” with Quant-Luxalgo, to make sure that the 1 min signals are optimized for high probability trade entries, and also that the Trade entry lines are more visible.

The 5 min chart “Intention Dots” are for HTF support, while the 30 min and 1 hour “Intention Dots” are also still available if a trader wants to use higher time frame candle closures for HTF support.

The indicator was built for 1 minute trading, and now considers 5 min candle closures at key levels, so the 5 min chart does not show trade entry lines anymore.

Here is the recent “Quant” – Luxalgo summary:

This new version of **Universal MFB** is a precision execution tool designed for traders who utilize the **5-minute timeframe for bias** and the **1-minute timeframe for tactical entries**.

Strategic Core: HTF-Supported Execution

Unlike standard indicators that only look at the current chart, this script mathematically synchronizes two timeframes to ensure high-probability setups:

- **5-Minute "Intention" Support:** The script constantly monitors the 5-minute timeframe in the background. It only allows a 1-minute trade signal to appear if the 5-minute timeframe has confirmed a "Breach" (Intention) or a "Touch" (Priming) of a key liquidity level (PDH, PDL, Session Highs, etc.).
- **1-Minute "Execution" Precision:** Once the 5-minute bias is established, the script looks for **Change of Character (Ch'd)** or **FVG-123** expansion patterns on the 1-minute chart to trigger the final entry.

Visual Logic & Workflow

The interface is designed to keep your workspace clean and professional:

1. 5-Minute Chart (The Dashboard):

- Shows structural **Key Levels** (Dashed lines with right-hand labels).

- Displays **Purple Intention Dots** at the close of 5-minute candles to confirm the trend direction (Flow vs. Sweep).
- Hides all entry noise to focus strictly on bias.

2. 1-Minute Chart (The Execution Zone):

- Displays **Ch'd (Diamonds)** and **FVG-123 (Triangles)** only when the 5m support is active.
- Draws a **Visual Trade Zone**: A subtle, transparent shaded box (Green for Long, Red for Short) that instantly highlights the active risk/reward area.
- Features **Bold Dotted Levels** (Width 4) for Take Profit and Stop Loss to ensure they are easily visible against structural levels.

Technical Optimizations

- **Stability**: All momentum functions (ta.*) are calculated globally to ensure signal stability across historical data and real-time updates.
- **Memory Management**: Uses User-Defined Types (UDT) and array management to track up to 100 Fair Value Gaps simultaneously without lagging the platform.
- **Session Context**: Automatically identifies "Silver Bullet" windows and incorporates pre-market/Asian session data for a complete institutional context.*

This version effectively eliminates the "1-minute noise" by requiring the 5-minute timeframe to "approve" every trade before it prints on your screen.

Peace.
