Beginner's description

MFB FVG-123 Delta Story Labels helps traders assess an FVG-123 setup using both price structure and footprint delta. It waits for price to return to a three-candle Fair Value Gap (FVG), then looks for a completed candle to close back beyond the gap in the expected direction.

- **Bullish setup:** Price revisits a bullish FVG, then a later bar closes above its upper boundary. The confirmation candle must also show enough positive delta relative to its volume.
- **Bearish setup:** Price revisits a bearish FVG, then a later bar closes below its lower boundary. The confirmation candle must show enough negative delta relative to its volume.
- **Label meanings:** "Bullish" or "Bearish FVG-123 delta" means the structure confirmed and the closing candle passed the delta threshold. "Not qualified" means the price structure confirmed, but the delta test did not pass. "Data unavailable" means required footprint readings were missing.
- **Why it may help:** Rather than treating the first move toward an FVG as a reason to chase, traders can wait for the retracement and confirmed close, then check whether order flow on that closing candle supports the move.

Important: In this version, approach and interaction delta must be available, but their direction does **not** have to agree for a pass. The directional test is based on the confirmation candle's delta-to-volume ratio (currently set to 15% on your chart). The label is drawn back at the FVG, so it appears beside the earlier gap only *after* confirmation; it is not an early signal.

Notes

- The indicator independently detects its basic three-candle FVG and return/close sequence; it does not read another indicator's private FVG-

123 signal or additional filters, so the results may not match those indicators exactly.

- A qualified label is evidence for review, not a probability estimate or a trade instruction.

Peace -
