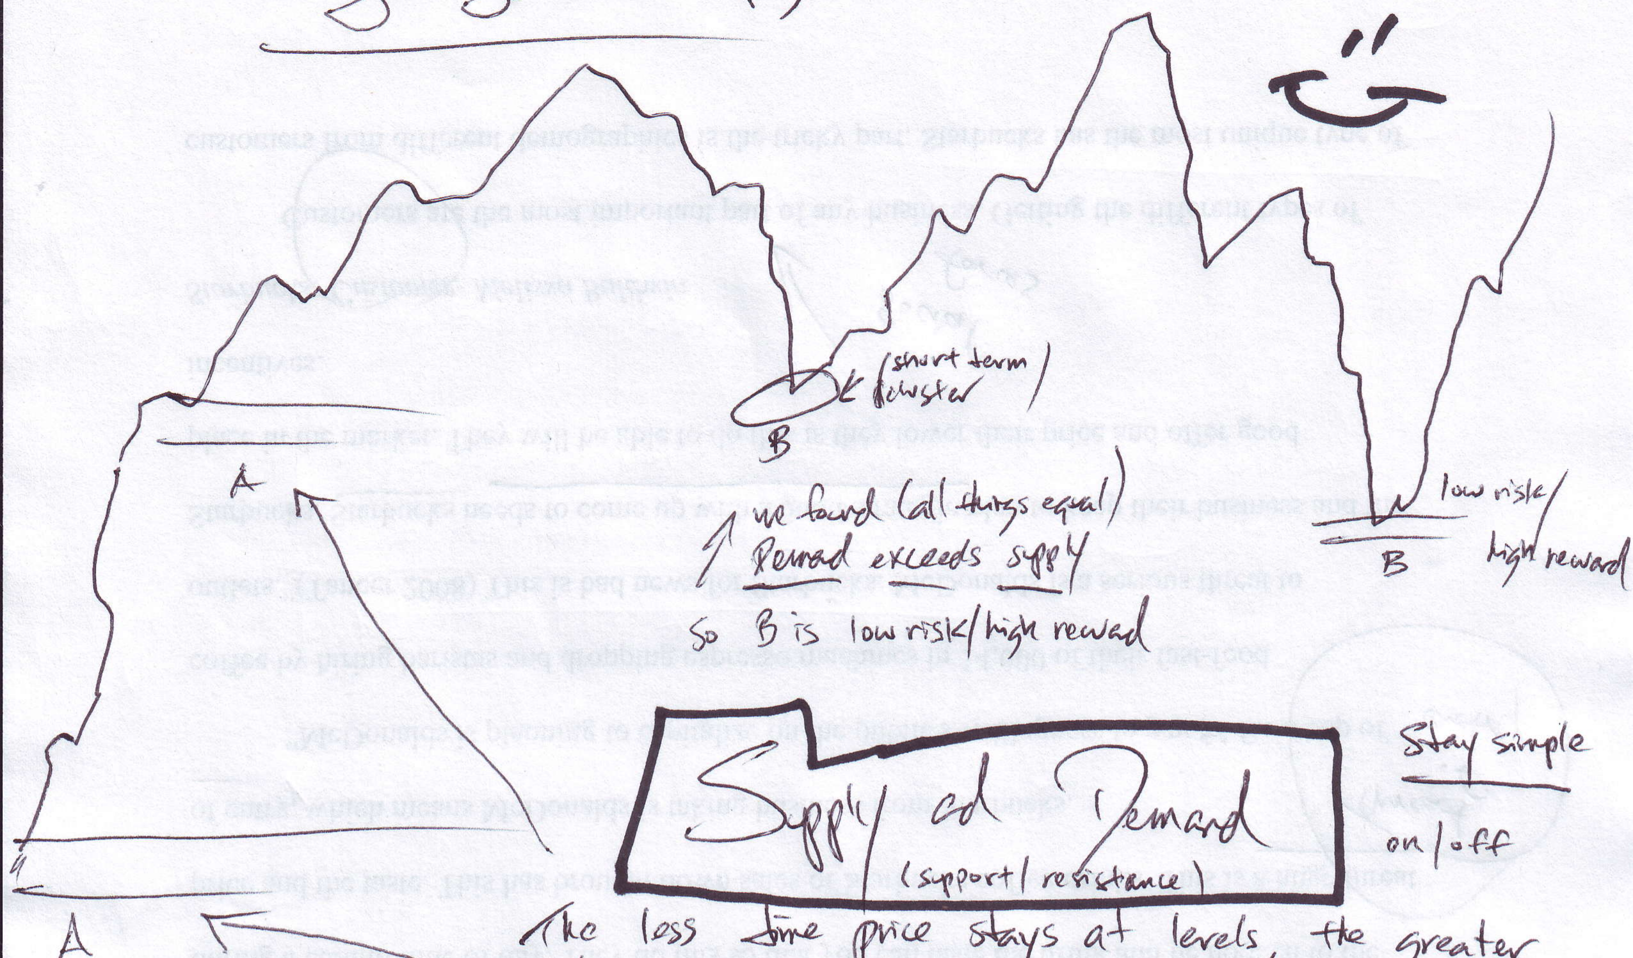
Thanks to Sam Seiden for helping



we found (all things equal) Demand exceeds supply

So B is low risk/high reward

Stay simple

on/off

Supply and Demand
(support/resistance)

The less time price stays at levels the greater imbalance there is between supply and demand.

Look at what trades are happening at what price.

Most people tend to buy in higher risk areas. .. Technical indicators are "lagged" ... happens after price movement ... trust volume (which tells us "fuel") and price. Even when SMA's are not telling us ... "lags"

http://transcripts.fxstreet.com/2007/11/supply-and-dema.html

Buy as the price leaves ("returned to level") to confirm long position and put a stop just beneath the level. (low risk/high reward) (limit order)

Fed news, bank leaders

* Moving averages don't confirm till later (lags) .... (less probability)

* Can use any indicators, but only when price confirms demand/supply movement. (level)

(sometimes the technical analysis can contradict price movement)
